Across the region 37% of all households are couples with children under 15 years of age, with some language groups this percentage is considerably higher. For example, within the Arabic speaking community 67% of people live in a household of a couple with children under 15 years of age. As is to be expected older migrant communities for example, the Dutch and German speaking communities, have considerably less of their community in this household type - the figures being 15% and 17% respectively. However, these two groups have a higher percentage of their population living in a household of a couple only - 37% and 31% of their respective populations. The percentage of the population for the region as a whole who live in this household type is 16%.
